

Student Answers - Machine Learning

Q1: What is machine learning?

Machine learning is a type of AI where computers can learn from data and make decisions without being told how to do it. It finds patterns in data using algorithms.

Q2: Explain supervised learning

Supervised learning is when a machine learning model is trained with labeled examples. The training data has both input and correct output, so the algorithm learns to map inputs to outputs.

Q3: What is the difference between regression and classification?

Regression predicts numbers like prices, classification predicts categories like cat or dog. They are different types of machine learning tasks.
